

Welcome to floorplanning for EDA

After clustering and partitioning, physical design asks a geometric question

What you'll build

- You'll start with outline legality, area, density, and deadspace
- Then slicing trees and polish expressions, B*-trees, and sequence pairs
- Simulated annealing searches those encodings
- Soft modules change aspect
- One idea per lab
- Complete and correct on scoped instances, not a production P&R engine

Stable module ids

- Module folders use hierarchical ids
- Odd slots leave room for inserts
- Treat published ids as stable keys; display order lives in the module index

Two tracks

- Every lab offers Track A, implement packing and metrics on tiny modules
- A good rhythm is browser first for the geometry, then implement to harden it
- Intro and wrap have no lab

How to move

- Read each README for outcomes, pick a track, or both, then work the checklist
- Keep legality, deadspace, and density as your habit
- When this intro checklist is done
