

Offline benchmark compare

Toy engines teach mechanism

Fair compare rules

- Use identical input
- Fix clocks and library delays
- Report the same metrics on both sides
- If the external tool is missing
- A clean I/O contract matters more than a flashy chart

What good looks like

- Expect your educational engine to be slower and sometimes less complete
- That's fine
- You're looking for the same qualitative behavior
- Huge unexplained wins usually mean a metric or exception mismatch, not genius

Your turn

- Follow the examples file, fill the comparison table, and finish the checklist
- Bring one discrepancy and a short hypothesis into your notes
- Then continue to the wrap module to close the course
