

Floorplanning path complete

You've walked the floorplanning path, from fixed outlines and deadspace,
through slicing, B*-tree

What you can do now

- You can pack modules under a W by H outline and prove legality
- You can compute deadspace as outline area minus the sum of module areas
- Assign boundary pins
- You are building algorithm literacy, not shipping a foundry floorplanner

Close the gaps

- If you mainly watched browser labs
- If you mainly coded, re-open visual labs for packing intuition
- Clustering and partitioning as prereqs should already feel connected

Next

- Complete the quiz for this part
- Natural next steps are `learn_placement`, spreading standard cells under the floorplan

Your turn

- Review the wrap checklist
- Name three representations and one strength each
- Say how deadspace is computed
- When you're ready, take the short quiz, then open `learn_placement` or `learn_legalization`
